

How to use these files

The attached files **do NOT work as a standalone project**.

Instead, you should use them to **compare my code** (in the *lib/* folder, as well as the *pubspec.yaml* file) **to your code**. Experience shows, that this helps you spot + fix 99% of all errors you might encounter.

If you want to **run the code**, you can do that as well though.

Follow these steps

- 1) Create a new Flutter project via *flutter create some_project*
- 2) Replace the *lib/* folder and the *pubspec.yaml* file with the attached files
- 3) **Possibly** add assets like images or fonts or adjust the *AndroidManifest.xml* / *Info.plist* file to add data/ permissions (only if covered in the previous lectures)
- 4) *flutter packages get*
- 5) *flutter run* (with a running emulator or real device connected to your machine) to view the app
