What's "State" and "State Management"

The User Interface is a **function of your data (state)**

Data	→	User Interface

State = Data which affects the UI (and which might change over time)
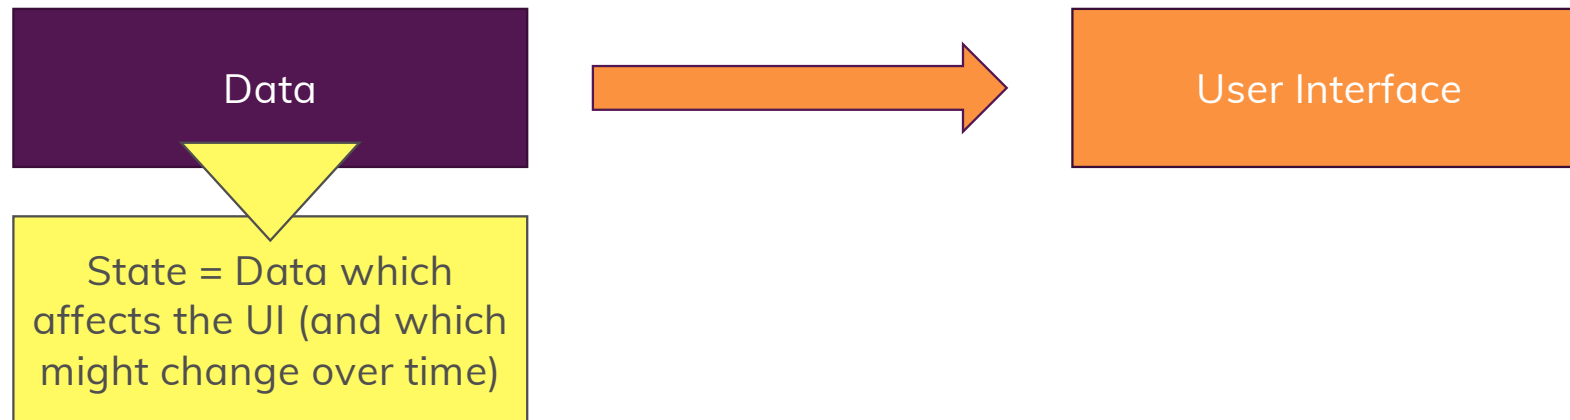

App-wide State		Widget (Local) State
Affects entire app or significant parts of the app		Affects only a widget on its own (does not affect other widgets)
Authentication ("is the user authenticated?"), Loaded Products, ...		"Should a loading spinner be displayed?", Form Input, ...
